10G XFP BIDI Optical Transceiver PN: OPP940-2733

Product Specification

Features:

- ♦ Supports 9.95Gb/s to 11.3Gb/s bit rates
- ♦ Hot pluggable 30 pin connector
- ♦ Compliant with XFP MSA
- ♦ Single LC for Bi-directional Transmission
- ❖ Transmission distance of 40km over Single mode fiber
- ♦ Uncooled 1270nm DFB Laser
- ♦ Single power supply voltages: +3.3V

- ♦ Temperature range 0°C to 70°C
- ♦ Power dissipation < 1.5W
- **♦** RoHS Compliant

Applications:

- ♦ 10GBASE-ER/EW Ethernet
- ♦ SONET OC-192 /SDH STM-64
- ♦ 1200-SM-LL-L 10G Fibre Channel

Description:

OPWAY' OPP940-2733 Small Form Factor 10Gb/s (XFP) transceivers are compliant with the current XFP Multi-Source Agreement (MSA) Specification. The high performance uncooled 1270nm DFB transmitter and high sensitivity PIN receiver provide superior performance for Multiple applications up to 40km links.

Notes

- 1. Connected directly to TX data input pins. AC coupling from pins into laser driver IC.
- 2. LOS is an open collector output. Should be pulled up with $4.7k 10k\Omega$ on the host board. Normal operation is logic 0; loss of signal is logic 1.

Note

- 1. Module circuit ground is isolated from module chassis ground within the module.
- 2. Open collector; should be pulled up with 4.7k-10k ohms on host board to a voltage between 3.15V and 3.45V.
- 3. A Reference Clock input is not required.

• Digital Diagnostic Functions

As defined by the XFP MSA, OPWAY's XFP transceivers provide digital diagnostic functions via a 2-wire serial interface, which allows real-time access to the following operating parameters:

- ✓ Transceiver temperature
- ✓ Laser bias current
- ✓ Transmitted optical power
- ✓ Received optical power
- ✓ Transceiver supply voltage

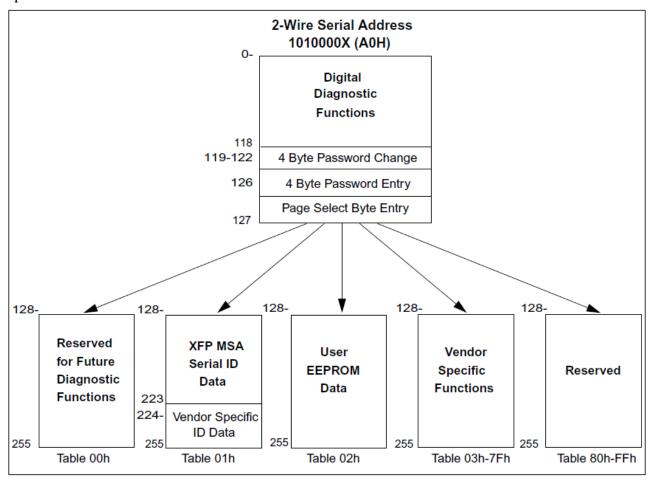

It also provides a sophisticated system of alarm and warning flags, which may be used to alert end-users when particular operating parameters are outside of a factory-set normal range.

The operating and diagnostics information is monitored and reported by a Digital Diagnostics Transceiver Controller (DDTC) inside the transceiver, which is accessed through the 2-wire serial interface. When the serial protocol is activated, the serial clock signal (SCL pin) is generated by the

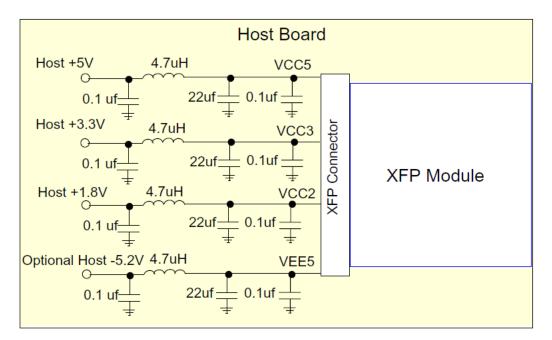

host. The positive edge clocks data into the XFP transceiver into those segments of its memory map that are not write-protected. The negative edge clocks data from the XFP transceiver. The serial data signal (SDA pin) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially. The 2-wire serial interface provides sequential or random access to the 8 bit parameters, addressed from 000h to the maximum address of the memory.

For more detailed information including memory map definitions, please see the XFP MSA Specification.
